

Computational Methods in Economics

AUTHOR

Prof. Lucas Finamor 

AFFILIATION

Sao Paulo School of Economics, FGV

Final Project

- What I expect: you to use some of the tools we learned in the course in something that will be useful for your research

For the presentation:

- It will be about 10 minutes (depending on the final number of students)
- Present the general economic/research problem
- Explain the computational method you are planning
- If you already have some results, you can show them, but I do not expect that

Final Project

- For the final project
 - Short write-up of the problem, method and results (3-5 pages).
 - Attach the code
 - It is a computational method course, so you can emphasize this part
 - For example, you may try different optimization algorithms. In a final paper you would never show intermediate steps. Here you are **very** welcome to do so.
 - It should be fully reproducible

Scores

- Scores will combine the “ambition” of the project and the execution

Important dates

- Presentations: **April 6th 09-11h, April 8th 16-18h**
- Final project: **April 21st 23h59**
- Late submissions: April 23rd 23h59 with 20% penalty
